A Project Report On

BOOKSAW

Online Book Ordering System

In partial fulfilment for the award of the degree of
Master of Computer Applications (MCA) – Semester III

Submitted By:
Bhimani Diya V.

Enrolment No.
255940694002

Submitted To
Gujarat Technological University

Submitted at
Shree Aryatej Institute of Management and Computer science

Acknowledgment

- I would like to express my heartfelt gratitude to everyone who supported and encouraged me throughout the successful completion of my project, **BOOKSAW**.

- First and foremost, I would like to thank **Professor Nikhil Dave**, my project guide, for his invaluable guidance, constant encouragement, and insightful suggestions throughout the development of this project. His expertise, patience, and constructive feedback were instrumental in helping me overcome challenges and successfully complete the project.

- I would also like to express my sincere appreciation to the faculty members of our department for providing the necessary knowledge, resources, and support during the course of this project.

- The development of **BOOKSAW**, a web-based food ordering and management system developed using **PHP**, **MySQL**, **HTML**, **CSS**, and **JavaScript**, has been a significant milestone in my academic journey. This project has enhanced my technical knowledge, problem-solving abilities, and practical understanding of web application development.

- Finally, I extend my heartfelt thanks to my family and friends for their continuous motivation, encouragement, and unwavering support throughout this project. Their confidence in me inspired me to complete this work successfully.

Yours Faithfully,
Diya Bhimani

Project Profile

Project Name	BOOKSAW (online book store system)
Project Type	Web Application
Language	PHP
Front-End	HTML, CSS, JavaScript, Bootstrap
Back-End	PHP
Editor	Visual Studio Code
Database	MySQL
Server	XAMPP
Documentation	LibreOffice Writer
Operating System	Windows
Submitted by	Diya Bhimani
Submitted to	Shree Aryatej Institute of Management and Computer science

Project Abstract

- The project titled **"BOOKSAW"** is a web-based online book ordering and management system developed using PHP, MySQL, HTML, CSS, JavaScript, and Bootstrap. The main objective of this project is to provide a secure and user-friendly platform where customers can browse books, place orders online, and manage their accounts, while administrators can efficiently manage book store operations.

- The application includes features such as user registration, book category management, book management, shopping cart, order placement and customer profile management. The admin module allows management of books, categories, orders, and website content through a centralized dashboard.

- BOOKSAW uses a MySQL database to store and manage user, book, and order information efficiently. The system simplifies online book purchasing, improves customer experience, and demonstrates the practical implementation of web development and database management concepts.

Project Introduction

- In today's digital era, online services have become an important part of daily life. The book industry is also adopting online platforms to provide faster and more convenient services to customers.

- **BOOKSAW – Online Book Ordering System** is a web-based application developed to simplify the process of online book purchasing and management. It provides a digital platform where customers can easily browse books, view book details, and place orders online.

- The admin can manage the complete system, including book categories, book details, customer information, orders, shipping details, and customer feedback. This helps in maintaining proper records and smooth management of book store services.

- Customers can register and log in, explore different book categories, view book information, add books to the cart, and place orders using the Buy Now option. Customers can also check order details and provide feedback through the system.

- The main objective of this project is to reduce manual work, save time, improve order accuracy, and provide a simple, secure, and user-friendly online book ordering platform for customers and administrators.

Scope of the Project

- The BookStore Online Book Ordering System is a web-based application developed to provide a fast, secure, and convenient platform for customers to purchase books online. The system is designed to simplify the traditional book purchasing process by allowing users to browse books, place orders, and communicate with the bookstore through an easy-to-use interface. It also provides an efficient administration panel for managing all website operations.

Customer Scope

The customer module enables users to perform the following functions:

- Register a new account and securely log in.
- Manage personal profile information.
- Browse different book categories such as Fantasy&Science, Biography&Memoir, Mystery&Thriller, History etc.
- View detailed information about each book, including cover image, description, price, and category.
- Search for books by category or title.
- Add multiple books to the shopping cart.
- Update book quantity or remove books from the cart.
- Use the Buy Now option for quick purchasing.
- Contact the bookstore through the Contact Us page for inquiries or support.
- Submit feedback or suggestions regarding the service.

Admin Scope

The admin panel provides complete control over the website and includes the following features:

- Secure administrator login.
- Dashboard displaying a summary of customers, categories, books, feedback, and orders.
- Add, edit, update, and delete book categories and books.
- Upload book categories.
- Add new books with title, category, price, cover image, and description.
- Edit or delete existing books.
- View registered customer information.
- View all customer orders with complete order details.
- Manage shipping information.
- View customer feedback and Contact Us messages.
- Maintain and update website content whenever required.
- Store and manage all information securely using the database.

Database Scope

The system maintains records for:

- Customer registration and login.
- Book categories.
- Books.
- Shopping cart.

- Orders.
- Shipping details.

Benefits of the System

- Reduces manual paperwork and order management.
- Provides customers with 24×7 online book ordering.
- Saves time for both customers and bookstore staff.
- Improves order accuracy and efficiency.
- Makes book catalogue management simple for administrators.
- Enables quick updating of books and categories.
- Maintains complete customer and order records.
- Provides a secure and user-friendly interface.
- Helps bookstores manage orders and deliveries efficiently.
- Improves customer satisfaction through faster service and better communication.

Project Planning

- Project planning is an important phase of software development that defines the activities, resources, time schedule, and approach required to complete the project successfully. Proper planning helps in developing the system in a systematic manner and ensures that all requirements are completed within the given time.

- The development of the **BookStore – Online Book Ordering System** is planned by dividing the project into different phases. Each phase focuses on specific activities required for designing, developing, testing, and implementing the system.

- **Requirement Analysis**

  In this phase, the requirements of the system are collected and analyzed. The features required for customers and administrators are identified, such as user registration, book category management, book management, shopping cart, ordering, shipping, and feedback management.

- **System Design**

  In this phase, the overall structure of the system is designed. Database design, user interface design, and system architecture are prepared. The flow of information between the customer, admin, and database is planned.

- **Development**

  In the development phase, the actual coding of the system is performed. Front-end pages, back-end functionality, and database connectivity are implemented according to the designed system.

- **Testing**

  The developed system is tested to identify and remove errors. Different testing methods are performed to ensure that all features such as login, book management, shopping cart, ordering, and admin functions work correctly.

- **Implementation**

  After successful testing, the system is deployed and made ready for use. The final application allows customers and administrators to perform their respective tasks efficiently.

- **Maintenance**

  After implementation, regular maintenance is performed to improve system performance, fix issues, and add new features according to future requirements.

The project planning process helps to complete the **BookStore – Online Book Ordering System** in a structured way while ensuring quality, reliability, and efficient use of resources.

Objectives of the Project

- The main objective of the **BookStore Online Book Ordering System** is to develop a web-based platform that simplifies the book ordering process and provides an efficient management system for customers and administrators.

The objectives of this project are:

- To develop an online platform that allows customers to purchase books easily from anywhere.
- To provide customers with a user-friendly interface for browsing book categories and book collections.
- To allow users to register, log in, manage their profiles, add books to the cart, and place orders online.
- To provide a **Buy Now** option for quick and convenient book purchasing.
- To reduce the manual work involved in traditional book ordering and management processes.
- To help administrators efficiently manage book categories, books, customer details, orders, and shipping information.
- To maintain accurate records of customers, books, and order details using a database.
- To provide secure access for users and administrators through authentication.
- To improve order processing efficiency and reduce errors in order management.

- To provide a better communication platform through customer feedback and **Contact Us** functionality.
- To enhance customer satisfaction by providing a fast, reliable, and convenient online book ordering experience.
- To implement web development and database management concepts in a real-world application.

Development Tools and Technologies

Front-End

HTML

- HTML is a standard markup language used for creating the structure and layout of web pages. It is used to define different elements of a website such as headings, paragraphs, images, links, tables, forms, and other content. HTML provides the basic framework of a web application and works together with CSS and JavaScript to create interactive and user-friendly web interfaces.

Role in Project:

- HTML is used in the project to design the front-end structure of web pages, including user interfaces, forms, navigation menus, and content presentation. It helps create the layout through which users interact with the application.

CSS

- CSS (Cascading Style Sheets) is a style sheet language used to control the design and presentation of web pages. It is used to customize the appearance of HTML elements by applying styles such as colors, fonts, spacing, borders, and layouts. CSS helps create attractive, responsive, and consistent designs across different devices.

Role in Project:

- CSS is used to design and style the front-end pages of the project. It helps improve the user interface by managing page layouts, adding visual effects, designing forms, buttons, menus, and making the website more user-friendly and responsive.

JavaScript

- JavaScript is a powerful scripting language used to make web pages interactive and dynamic. It allows developers to add functionality such as user interactions, animations, form validation, event handling, and real-time content updates. JavaScript works along with HTML and CSS to create modern and responsive web applications.

Role in Project:

- JavaScript is used to enhance the functionality of the project by handling user events, validating user input, creating interactive features, and improving the performance and user experience of the website. It helps make the application more responsive and user-friendly.

Bootstrap

- Bootstrap is a popular open-source front-end framework used for designing responsive and mobile-friendly websites. It provides ready-made components such as buttons, forms, navigation bars, cards, and layouts that help developers create attractive web interfaces quickly.

Role in Project:

- Bootstrap is used to improve the design and responsiveness of the project. It helps create a user-friendly interface by providing pre-designed UI components, responsive layouts, and consistent styling across different devices.

Back-End

PHP

- PHP (Hypertext Preprocessor) is a widely used open-source server-side scripting language designed for web development. It is used to create dynamic and interactive websites by processing data on the server. PHP can connect with databases such as MySQL to store, manage, and retrieve application data. It provides features like session management, form handling, authentication, and secure data processing.

Role in Project:

- PHP is used as the backend technology of the project to handle server-side functionality. It manages user registration and login, processes customer requests, communicates with the database, and performs CRUD operations (Create, Read, Update, Delete) for managing application data. It helps in developing a secure, efficient, and dynamic web application.

Database

MySQL

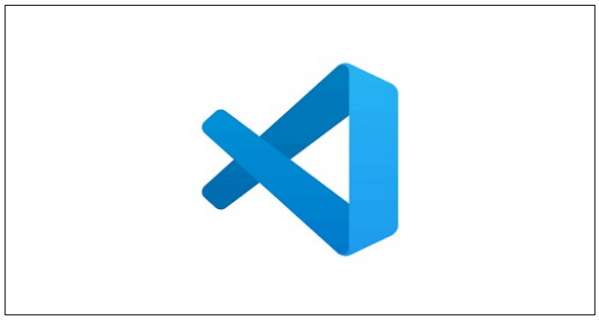

- MySQL is an open-source relational database management system (RDBMS) used to store, manage, and retrieve data efficiently. It uses SQL (Structured Query Language) to perform database operations such as creating tables, inserting data, updating records, and retrieving information. MySQL provides a secure and reliable way to manage application data.

Role in Project:

- MySQL is used as the database system for storing and managing project data. It stores information such as user details, product/food details, orders, and other application records. It works with PHP to perform database operations and maintain data efficiently.

Development Environment

Visual Studio Code

- Visual Studio Code (VS Code) is a lightweight and powerful source code editor developed by Microsoft. It supports multiple programming languages and provides features such as syntax highlighting, debugging, extensions, and code completion. It helps developers write, edit, and manage project files efficiently.

Role in Project:

- Visual Studio Code is used as the development environment for writing and managing the project's source code. It provides tools for editing HTML, CSS, JavaScript, PHP files, and helps in debugging and organizing the project structure.

XAMPP

- XAMPP is an open-source local server environment used for developing and testing web applications. It includes important components such as Apache web server, MySQL database, PHP, and Perl. XAMPP allows developers to run PHP-based applications on a local computer before deploying them to a live server.

Role in Project:

- XAMPP is used to provide a local development environment for the project. It helps run PHP files through the Apache server and manages the MySQL database using phpMyAdmin. It allows testing and debugging of the web application locally.

System Analysis

- The existing book ordering process in many bookstores is largely manual or telephone-based. Customers either visit the bookstore or place orders by phone. Bookstore staff manually record customer details, book information, prepare bills, and manage book delivery. This traditional method often leads to delays, errors, and inefficient order management, especially during busy periods.

Limitations of the Existing System

- Customers must visit the bookstore or make phone calls to place orders.
- Manual order recording increases the possibility of human errors.
- Longer waiting time during busy hours.
- No real-time order status or tracking facility.
- Difficulty in maintaining customer records.
- Limited payment options.
- Manual report generation consumes additional time.
- Poor inventory and sales management.
- Problems Identified
- Inefficient communication between customers and the bookstore.
- Increased paperwork.
- Delay in order processing.
- Lower customer satisfaction.

Proposed System

- The proposed **Online Book Ordering System** is a web-based application that automates the complete book ordering process. It allows customers to browse book categories, search for books, view book details, place orders, make online payments, and track order status. Administrators can manage book categories, books, customers, orders, shipping information, and reports through an administrative dashboard.

Objectives of the Proposed System

- To automate the book ordering process.
- To minimize human errors.
- To provide fast and efficient service.
- To improve customer satisfaction.
- To maintain centralized customer and order records.
- To generate reports automatically.
- To support secure online payment methods.

Features of the Proposed System

- User Registration and Login
- Book Categories Display
- Book Search and Categories
- Shopping Cart
- Buy Now Option

- Online Book Ordering
- Customer Profile Management
- Admin Dashboard
- Book Category Management
- Book Management
- Order Management
- Shipping Management
- Contact Us
- Customer Feedback

Advantages of the Proposed System

- Faster order processing.
- Improved customer service.
- Reduced paperwork.
- Accurate billing.
- Better inventory management.
- Real-time order updates.
- Secure payment system.
- Easy report generation.

Feasibility Study

- A feasibility study determines whether the proposed **Online Book Ordering System** is practical, cost-effective, and capable of meeting organizational requirements.

1. Technical Feasibility

- The proposed system is technically feasible because the required technologies and development tools are readily available.

Technologies Used

- **Front-end:** HTML, CSS, JavaScript, Bootstrap
- **Back-end:** PHP
- **Database:** MySQL
- **Web Server:** Apache (XAMPP)
- **Browser:** Google Chrome, Microsoft Edge

Hardware Requirements

- **Processor:** Intel Core i3 or above
- **RAM:** 4 GB minimum
- **Storage:** 250 GB
- **Internet Connection**
- The development environment supports all required functionalities, making the project technically feasible.

2. Economic Feasibility

- The proposed system requires only standard hardware and open-source software, which significantly reduces development costs.

Benefits

- Reduced operational costs.
- Less paperwork.
- Faster order processing.
- Increased customer satisfaction.
- Improved bookstore productivity.
- Better inventory and sales management.
- Since the expected benefits outweigh the development and maintenance costs, the project is economically feasible.

3. Operational Feasibility

- The system is designed to be user-friendly and easy to operate by customers and administrators.

Operational Benefits

- Easy online book ordering.
- Simple navigation.
- Quick order processing.
- Efficient customer management.
- Reduced workload for administrators.

- Improved customer experience.
- Minimal training is required because the application follows a simple and intuitive interface.

4. Schedule Feasibility

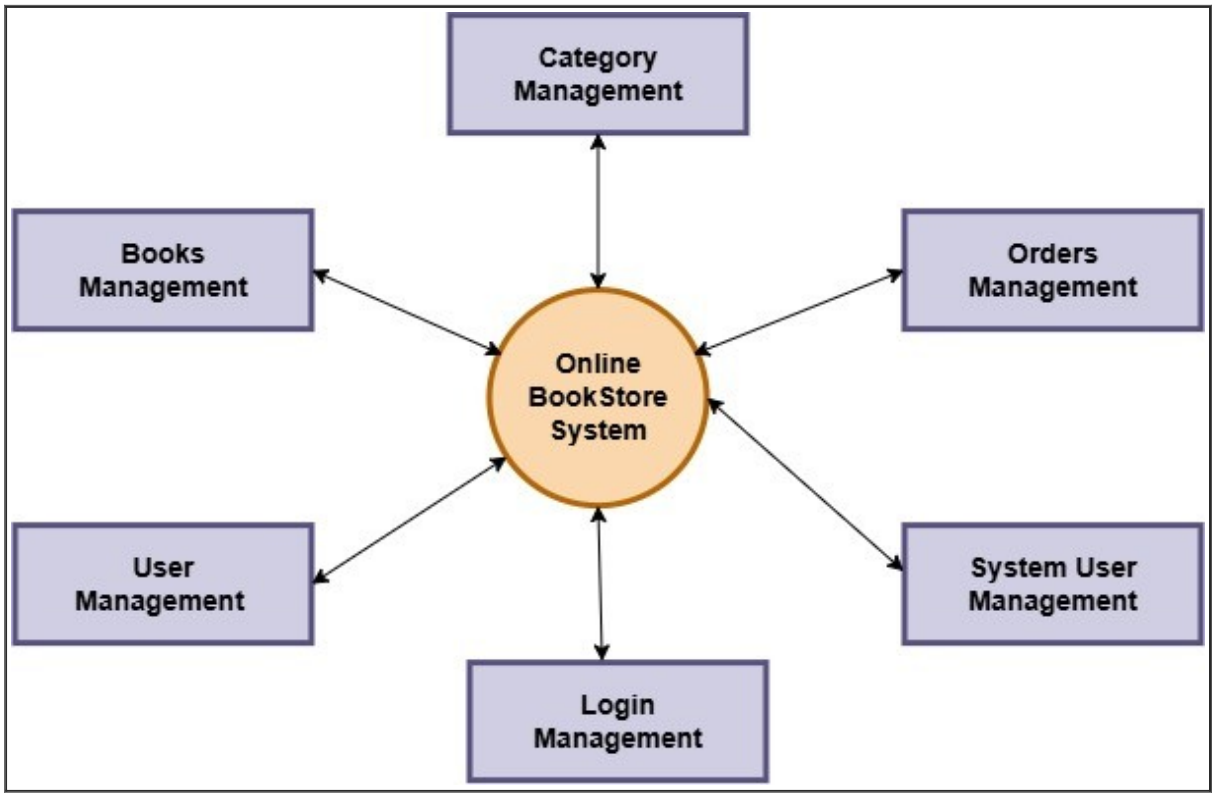

- The project can be completed within the planned academic timeline.
- Development Phases
- Requirement Gathering
- System Analysis
- System Design
- Database Design
- Coding and Implementation
- Testing
- Deployment
- Maintenance
- Proper planning and resource allocation ensure timely completion of the project.

The proposed **Online Book Ordering System** provides an efficient and automated solution for managing book sales and customer orders. Compared with the existing manual system, it offers faster service, greater accuracy, improved customer satisfaction, and better management of books, orders, shipping, and reports. The feasibility study confirms that the system is technically, economically, operationally, and schedule-wise feasible, making it a suitable solution for modern bookstores.

System Module

Admin Module

- Manages the entire system, including users, book categories, books, orders, shipping, feedback, and contact enquiries.

User Module

- Allows customers to register/login, browse books, search books, manage profiles, add books to the cart, place orders, and provide feedback.

Category Module

- Manages book categories such as Fiction, Non-Fiction, Academic, Children's Books, and Biography.

Book Module

- Stores and manages book details such as title, author, ISBN, description, price, cover image, stock availability, and category.

Cart Module

- Allows users to add books to the cart, remove books, update quantities, and review selected books before placing an order.

Order Module

- Handles book order placement, order details, payment status, order history, and order tracking.

Shipping Module

- Manages delivery information, customer addresses,and delivery updates.

Feedback Module

- Allows customers to submit ratings, reviews, and comments about books and services.

Contact Module

- Allows customers to send enquiries or messages through the Contact Us page, and enables administrators to view and manage customer enquiries.

Testing

Test Id	Test Case	Expected Result
TC01	User Registration with valid details	User account is created successfully.
TC02	User Registration with existing username	System displays "username already exists."
TC03	User Login with valid credentials	User is redirected to the home page/dashboard.
TC04	User Login with invalid credentials	System displays an "Invalid username or password" message.
TC05	Admin Login with valid credentials	Admin is redirected to the admin dashboard.
TC06	Admin Login with invalid credentials	System denies access and displays an error message.
TC07	Contact form submission	Contact message is submitted successfully.
TC08	Browse food categories	All available food categories are displayed correctly.
TC09	View foods by category	Selected category displays only its related food items.
TC10	Search for a food item	Matching food items are displayed.
TC11	View food details	Food name, image, price, and description are displayed correctly.
TC12	Add food item to cart	Selected food item is added to the shopping cart.
TC13	Update food quantity in cart	Cart quantity and total price are updated correctly.

Test Id	Test Case	Expected Result
TC14	Remove food item from cart	Selected item is removed from the cart successfully.
TC15	Place an order	Order is placed successfully and a confirmation message is displayed.
TC16	Make successful payment	Payment is processed and the order is confirmed.
TC17	Admin views registered users	Admin can view the complete list of registered users.
TC18	Admin manages categories	Admin can add, edit, and delete food categories successfully.
TC19	Admin manages food items	Admin can add, edit, update, and delete food items successfully.
TC20	Admin views customer orders	Admin can view all customer orders with complete details.
TC21	Admin views Feedback users	Admin can view the complete list of feedback users.
TC22	User logs out	User successfully redirected to the login page.
TC23	Admin logs out	Admin successfully redirected to the login page.

Conclusion

- The Online Book Ordering System is a web-based application developed to simplify the process of purchasing books online. The system provides a user-friendly interface where customers can register, browse book categories, search for books, add books to the cart, use the Buy Now option, place orders, and track their order details. It also includes an admin panel that allows administrators to manage book categories, books, customer orders, users, shipping information, feedback, and contact enquiries efficiently.

- The project is developed using PHP, MySQL, HTML, CSS, JavaScript, and Bootstrap, ensuring a responsive, secure, and easy-to-use platform. It reduces manual work, improves order management, minimizes errors, and provides a better experience for both customers and administrators.

- Overall, the Online Book Ordering System successfully achieves its objectives by providing a fast, reliable, and efficient solution for purchasing books online. It can be further enhanced by adding features such as online payment integration, real-time order tracking, book recommendations, wishlist functionality, email notifications, and mobile application support in the future.

Future Scope

Possible Improvements and Additional Features

- The Online Book Ordering System can be enhanced by integrating secure online payment gateways such as UPI, credit/debit cards, net banking, and digital wallets for faster and more convenient transactions. Real-time order tracking can also be added to improve customer experience.

- A mobile application for Android and iOS can make the platform more accessible. Features like customer reviews, book recommendations, and support for multiple bookstores can further improve user engagement.

- Additional improvements include advanced search, wishlist, e-book support, stronger security, and sales analytics. These enhancements will make the system more efficient, scalable, secure, and suitable for real-world commercial use.

THANK YOU

Thank you for reviewing this project report.

I would like to express my sincere gratitude to my project guide, faculty members, and everyone who supported and encouraged me throughout the development of this project. Their valuable guidance and support helped me successfully complete this work.

I hope this project, "**Online Book Ordering System**," fulfills its objectives and reflects the knowledge and skills I have gained during my MCA program.

Thank You!
